Adolescent Sleep Phase Shift

When teens go through puberty, their bodies release melatonin about two hours later. This results in a shift from a bedtime of 8-9 p.m. to 10-11 p.m., or even later for some teens. The Forbidden Zone is when we are maximally alert and cannot fall asleep. While everyone is individual in their sleep needs, with some teens early to bed and others being more night owls, the majority of teens are not getting the sleep they need. Two out of three high school students get less than 8 hours of sleep a night. Experts recommend that adolescents get 8.5–9.5 hours of sleep per night.

In schools with later start times, studies show teens will get more sleep. Getting adequate sleep helps with:

- Attention, learning, and memory, which directly impacts academic performance
- Physical and mental health to help prevent obesity and minimize depression as well as many other benefits
- Behavior and emotional regulation
- Decreased risk of sports and other injury, teens getting less than 8 hours of sleep each night experience 68% more sports injuries
- Decreased risky behaviors

Starting school later, and giving our children the ability to gain more sleep, is just one piece of the puzzle in helping to manage our children’s stress level.

If we start school later, won’t students just go to bed later or stay up later doing homework?

This common misconception seems reasonable enough. But it has not proven true in most studies of students who have had their schools shift to later start times. Several studies found that when schools move to later morning starts, students consistently got more sleep per school night because they went to bed at or near the same time each night and were able to rise later in the morning. When teens sleep and wake up in their more natural sleep/wake cycles, they are less drowsy and more focused in morning classes, and more efficient in getting their assignments done. They are no longer struggling to keep up with their homework due to fatigue.

Sleepless in Fairfax: The Difference One More Hour of Sleep Can Make for Teen Hopelessness, Suicidal Ideation, and Substance Use

Multi-state study, Wahlstrom 2014
Advocates for Later Start Times

- American Academy of Pediatrics (AAP)
- American Medical Association (AMA)
- Centers for Disease Control and Prevention (CDC)
- National Association of School Nurses
- Society of Pediatric Nurses
- American Academy of Child & Adolescent Psychiatry
- National Sleep Foundation
- The AAP, AMA, and CDC recommend that middle and high schools start no earlier than 8:30 a.m.

Experience With Later Start Times

- Hundreds of schools across the country have changed to start middle and high schools later and this has allowed for longitudinal research on the effectiveness of this intervention.
- Results show that starting school later leads to increased sleep, improved attendance and attention, increases in educational performance and standardized testing, less sleeping in class, and fewer disciplinary referrals.
- Other results include: decreased number of traffic accidents and reduced incidents of depression and anxiety in middle and high school students.
